

Therapy guidelines

The Viscum-Vet Group uses the mistletoe preparation **Iscador®**. This preparation uses fermented extracts of leaves, stems, buds and ripe berries during the winter harvest. Different preparations can be distinguished on the basis of the host trees on which the mistletoes were harvested. In animals, **Iscador® P** (pine mistletoe), **Iscador® M** (apple tree mistletoe) and **Iscador® Qu** (oak mistletoe) are most commonly used.

Further information on the mistletoe preparation can be found at www.iscador.com

Iscador® is usually administered by subcutaneous injection. Depending on its effectiveness and the stage of disease, the therapy can last from a few months to several years. For some tumour diseases, the preparation can also be administered orally.

Mistletoe therapy is very well tolerated in animals. However, cancer is a serious disease, the course of which should be closely monitored by a veterinarian.

Therapy options

Your veterinarian can register at www.viscumvet.org using the contact form and obtain all the information required for mistletoe therapy.
